

```

loc_4015E7:
push    offset aLevel1WhyDidTh ; "### Level 1: Why did the clever program"...
call    ds:OutputDebugStringW
push    7
call    sub_401440
add     esp, 4
call    ds:IsDebuggerPresent
test    eax, eax
jz      short loc_40161B

```

The full string on that is:

```

.rdata:004034C0      text "UTF-16LE", '### Level 1: Why did the clever programmer become a'
.rdata:00403526      text "UTF-16LE", ' gardener? Because they discovered their talent for'
.rdata:0040358C      text "UTF-16LE", ' growing a ',27h,'patch',27h,' of roses!',0Ah,0

```

‘Patch’ - looks like that’s our clue. We can also see that in the disassembly of this section, this function calls a function named “IsDebuggerPresent”, which obviously checks if the session is currently debugging. So let’s try running it.

Indeed, we were brought to this section:

```

.text:002E1606 push    offset aOopsTheDebugge ; "### Oops! The debugger was detected. Tr"...
.text:002E160B call    ds:OutputDebugStringW
.text:002E1611 jmp     loc_2E16A2

```

So to avoid that, we should just reverse the jump (jz) instruction, so that we go the other way. This is the only thing that we need to do and we instantly got the flag after stepping into a couple more instructions.
